TOA Cadaveric Workshop

義大醫院骨科部

吳金獻(CH Wu)

馬景候(CH Ma)

杜元坤(YK Tu)

Objectives

- Dorsal approach for distal radius
- Tendon transfer for radial nerve palsy

The Distal Radius Fractures

- The most common upper extremity fractures, 20%
- Bimodal distribution
sport injuries at a younger age
fragility fracture

~Karl JW. *J Orthop Trauma* 2015

Goals of Treatment

- Restore the neutral anatomy:
Joint Surface (distal radius and DRUJ) to within 1mm – *Knirk and Jupiter*
- Provide stability for early finger and elbow ROM
- Be aware of associated injuries

When to operate (AAOS)?

- Surgical fixation

- Post-reduction film

- Radial shortening > 3mm
- Dorsal tilt >10 deg
- Intra-articular displacement > 2mm

Treatment of Distal Radius Fractures . *J Am Acad Orthop Surg* 2010;18: 180-189

How to Approach

- Surgical indications : 年長者, 日常生活活動量少, 可考慮保守療法

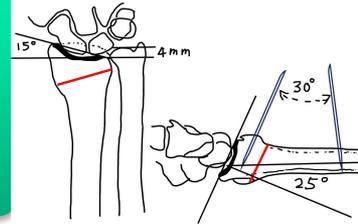

~Arora R. *JBJS A* 2011

~Nelson GN. *JOT* 2015

- PreOP planning: type of fixation, implants, approach, ulnar-side procedures

PreOP planning

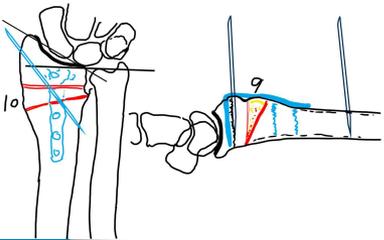

Type of fixation: external, internal

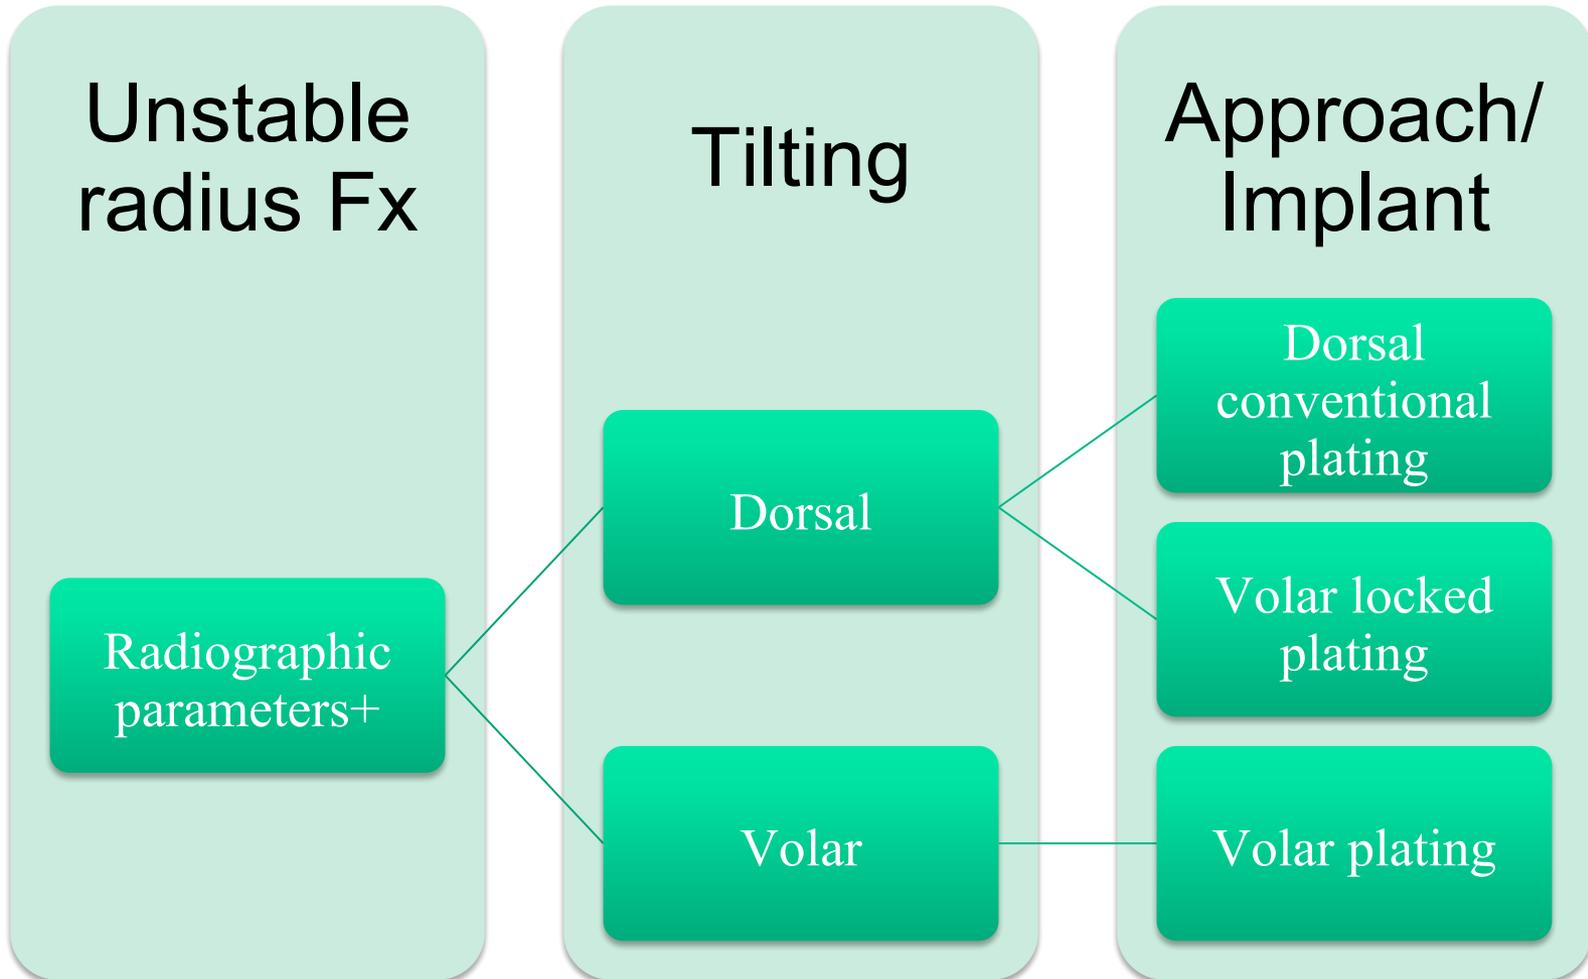

Implants: conventional, locked plating

Approach: palmar, dorsal, or Both

Ulnar-side procedures and other injuries

Previous Concept

Volar locked plating

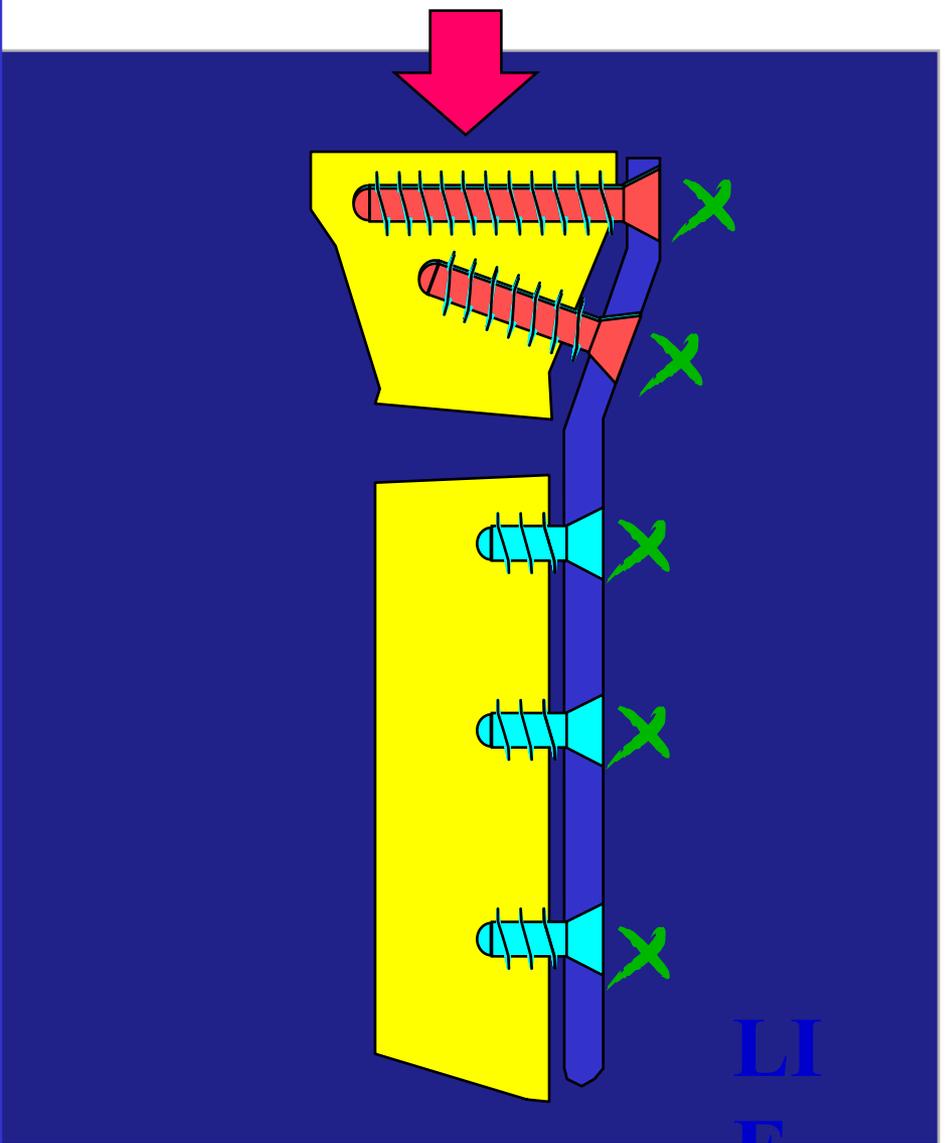

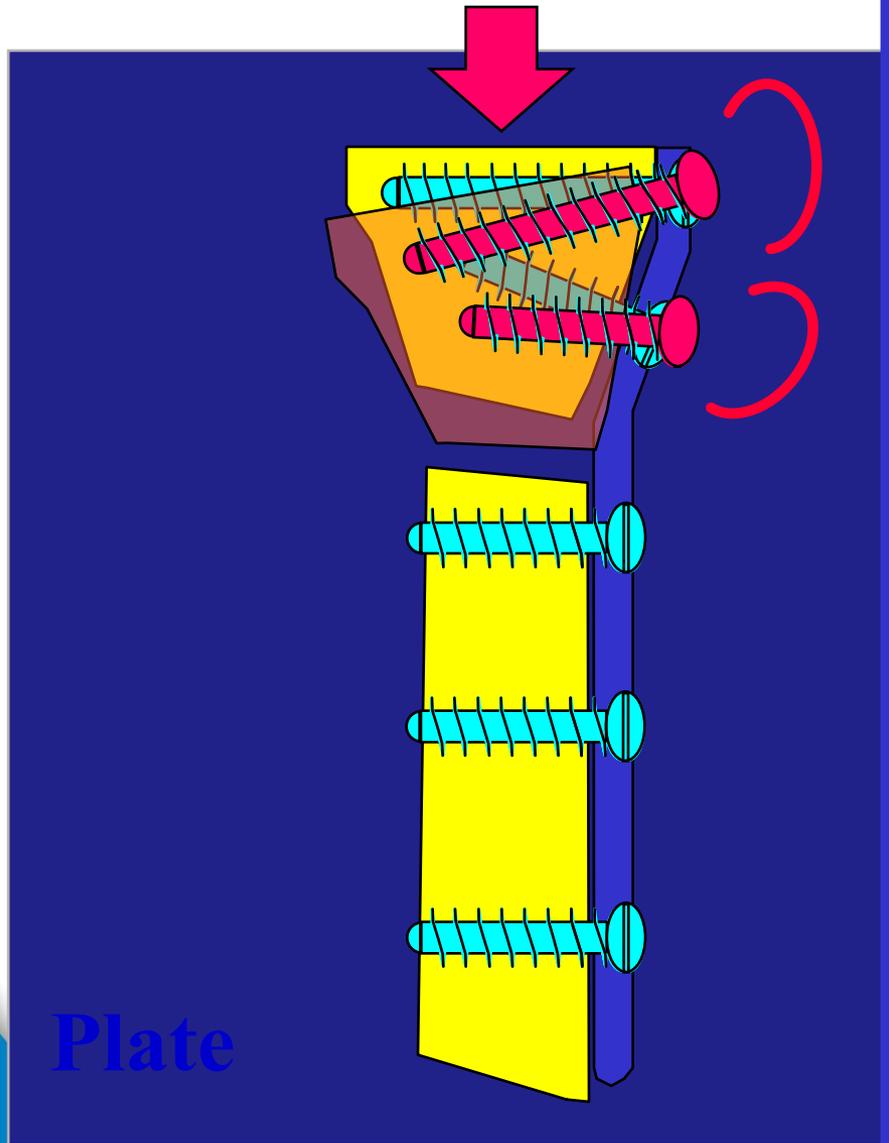

Closed reduction
and percutaneous
pinning

~Costa ML. *Health Technol Assess Am* 2015
~Chaudhry H. *CORR* 2015

Comparison: Secondary Loss of Reduction

Standard Plate

Locked Internal Fixator

LCP a very complete portfolio

Basic plate **High-end plate**

The diagram illustrates the difference between a basic locking compression plate (LCP) and a high-end LCP. The basic plate is a long, narrow plate with a simple T-shaped head and five locking holes. The high-end plate is shorter and wider, with a more complex, anatomically shaped head and multiple locking holes. An anatomical illustration of a human arm shows the basic plate applied to the humerus, while another shows the high-end plate applied to the humerus. A comparison bar at the bottom lists five factors: Convenience for surgeon, Stability of fixation, Specific anatomical, In consideration of clinical need, and Price per cas.

Factor	Basic plate	High-end plate
Convenience for surgeon	Low	High
Stability of fixation	Low	High
Specific anatomical	Low	High
In consideration of clinical need	Low	High
Price per cas	Low	High

Both volar/dorsal angulation → volar locking plating (fixed-angle devices)

~JeudyJ, et al. Injury 2012

Dorsal Approach

INDICATIONS FOR DORSAL PLATE FIXATION:

- Associated intercarpal ligament injury
- Displaced dorsal lunate facet fracture
- A dorsal shearing radiocarpal fracture-dislocation

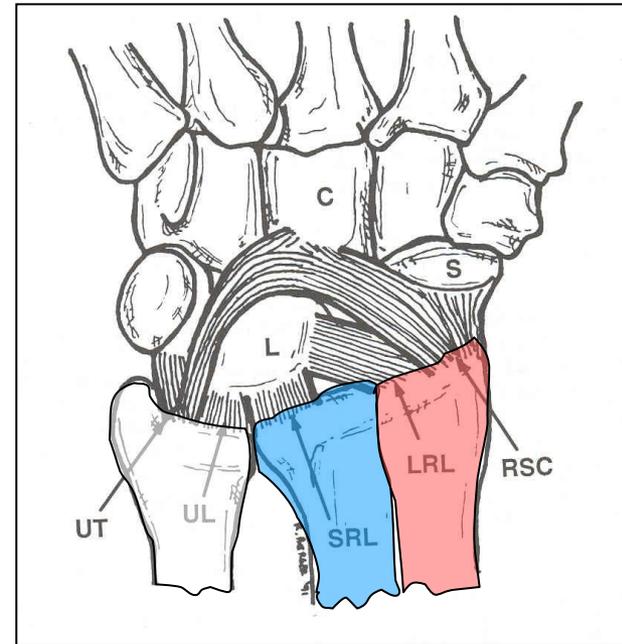

~Jupiter JB. *JBJS A* 2010

Periarticular rim fracture: Dorsal shearing radiocarpal fracture-dislocation

Three column theory [Rikli DA, et al 1996]

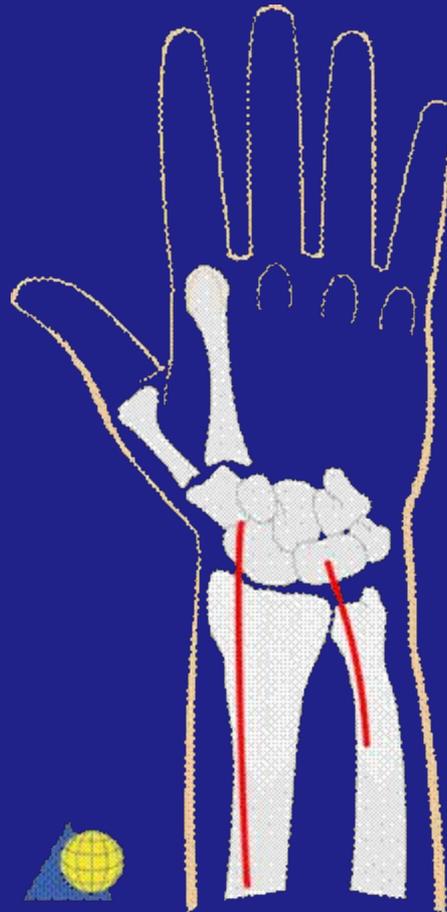

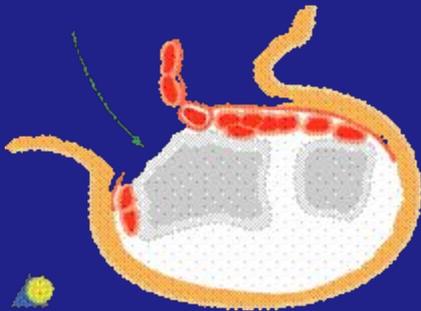

- **Radial Column: *Stability***
 - Osseous buttress radially
 - Insertion for stabilising capsular ligaments
- **Intermediate Column: *Load Transmission***
 - *Key to the radiocarpal joint*
- **Ulnar Column: *Load Transmission & Stability***
 - „Ulnar Pivot“

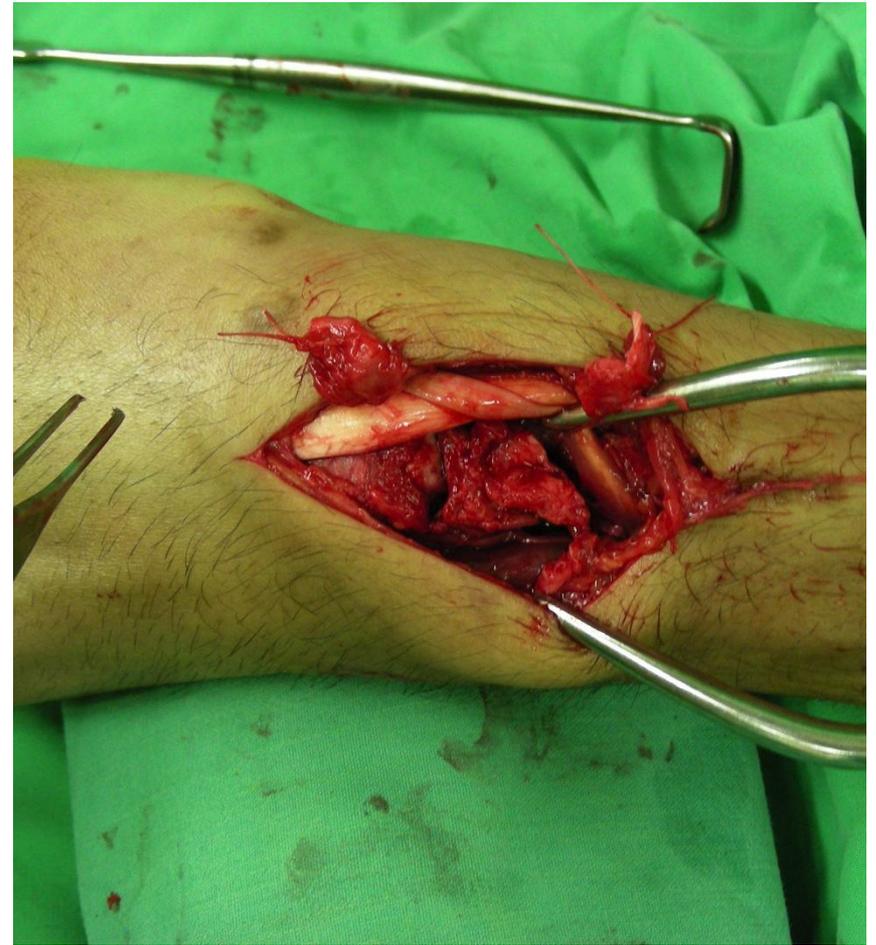

WHICH APPROACH?

DORSAL

2nd-3rd DC

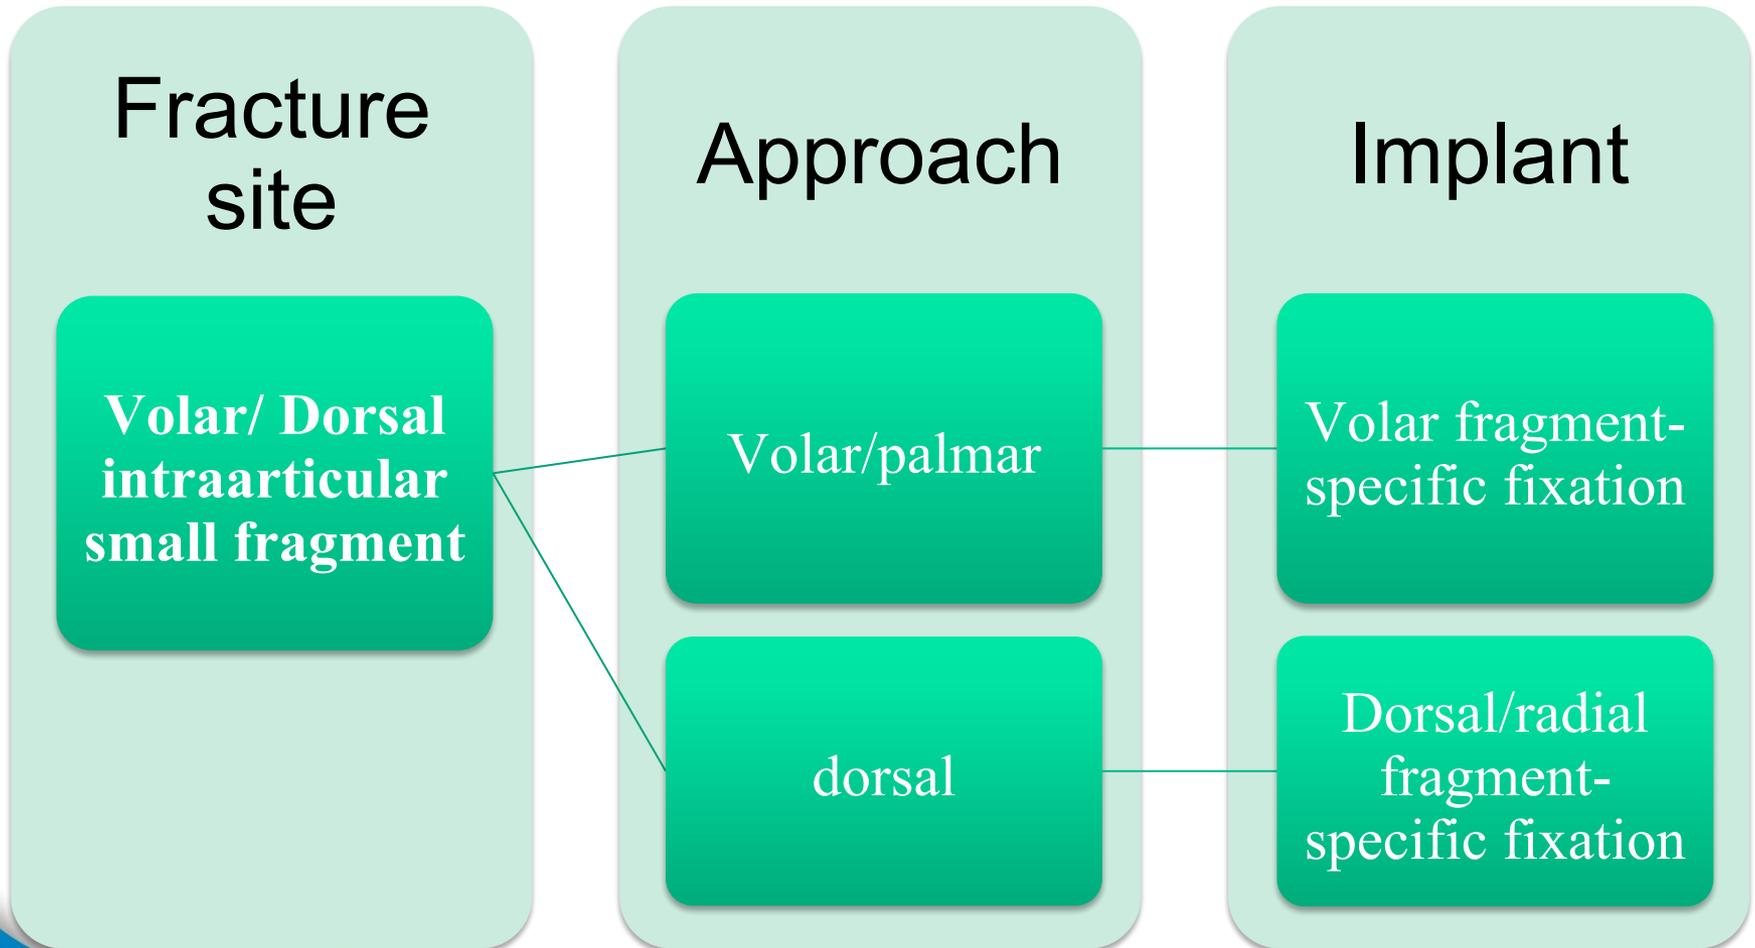

Dorsal approach

Dorsal fragment-specific fixation

Fragment-specific fixation

Humeral shaft fractures

Immediate radial nerve exploration

- - Open fractures
- - Distal-third spiral fractures
- - Secondary palsy following closed reduction

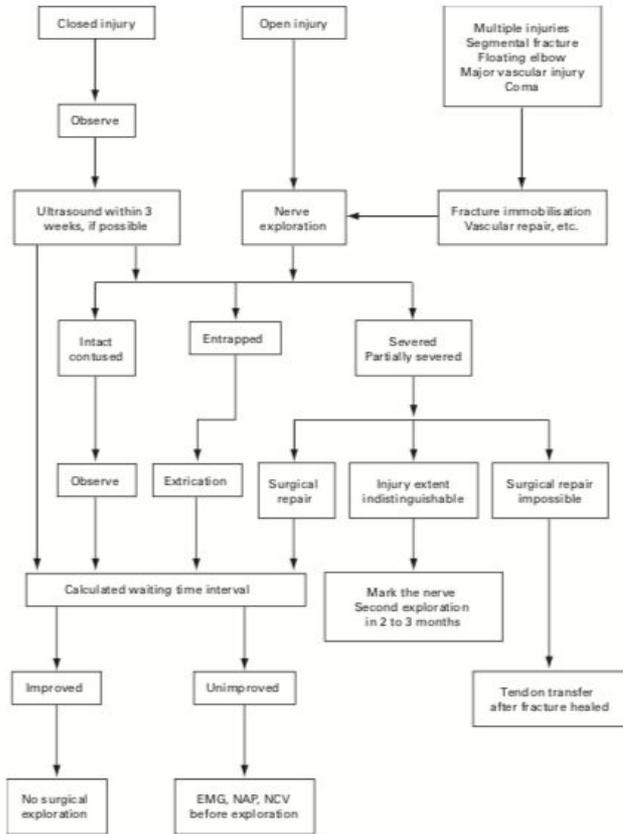

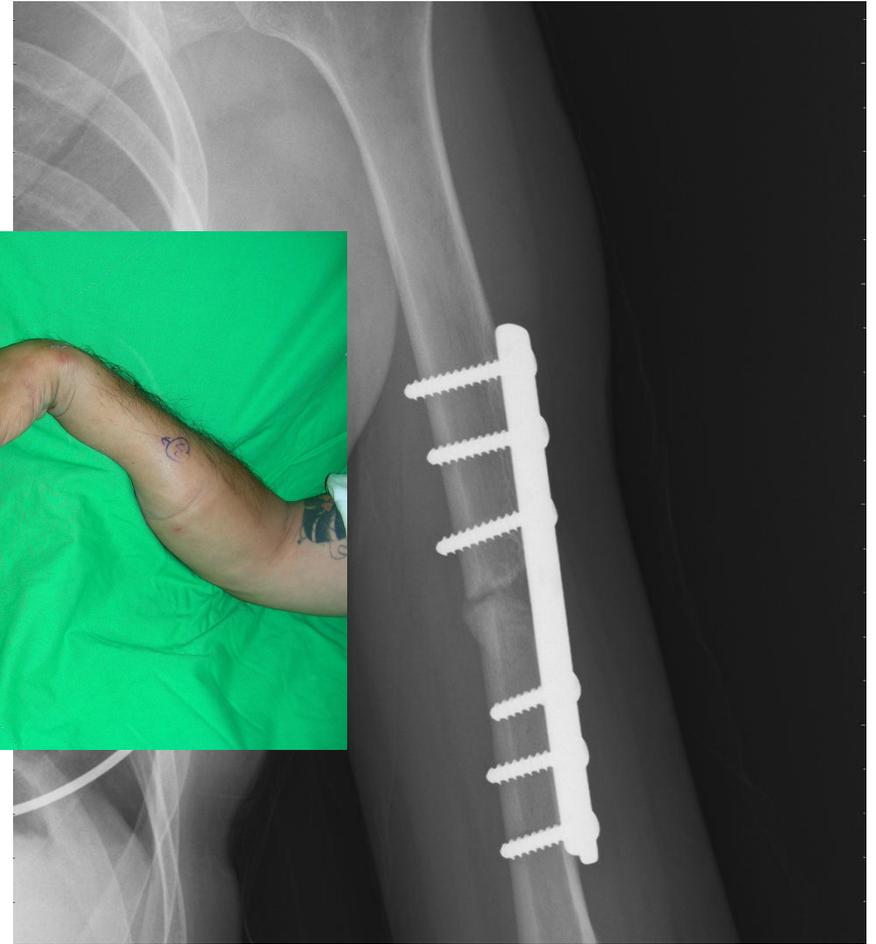

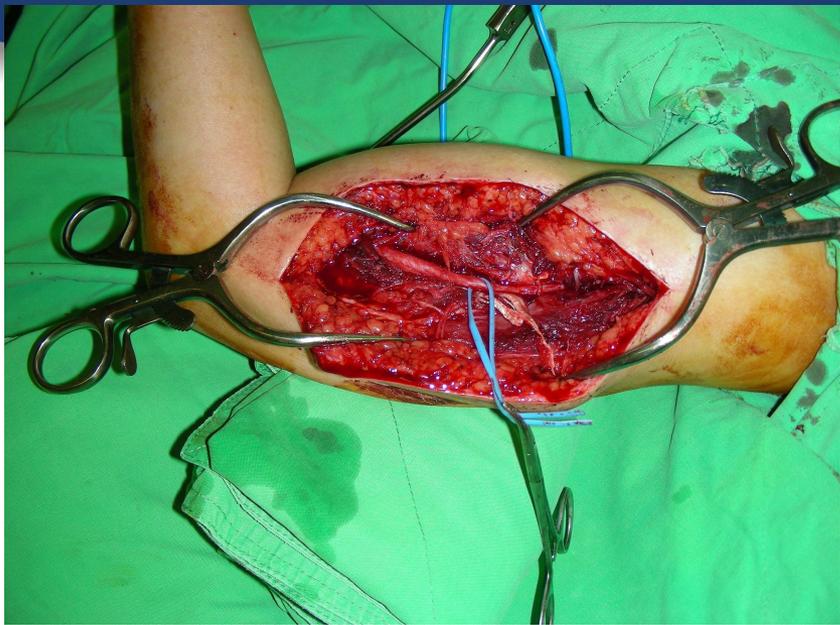

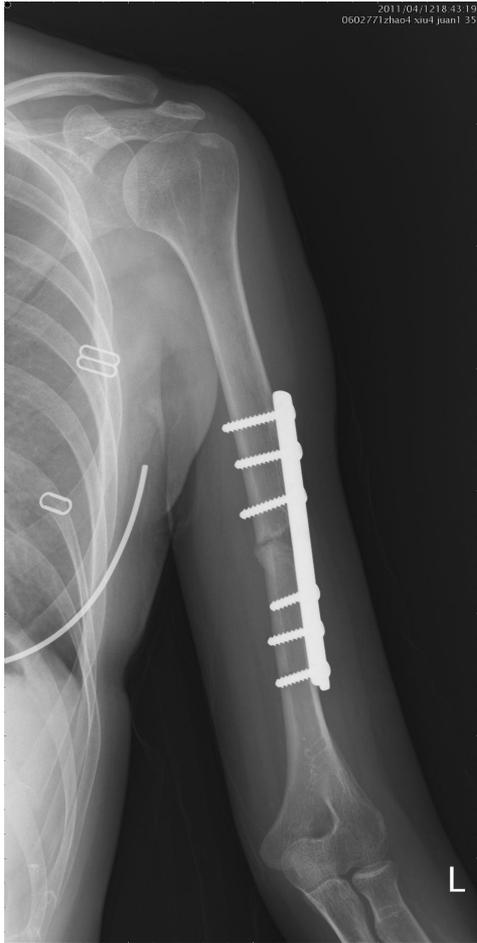

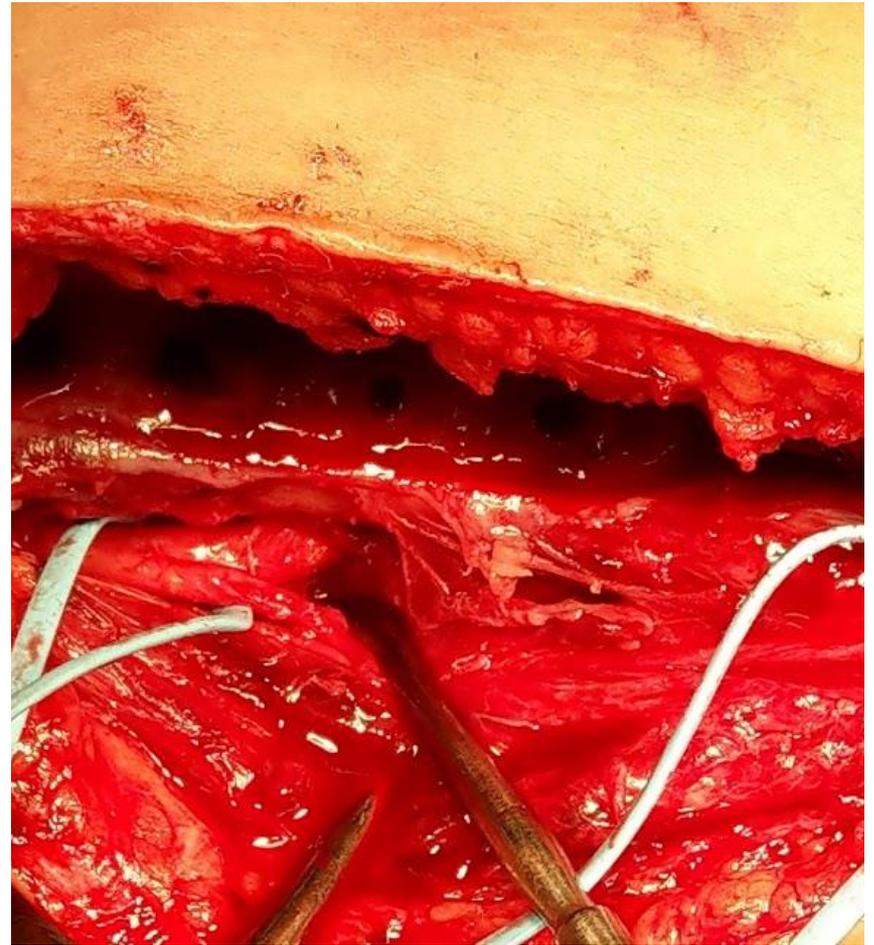

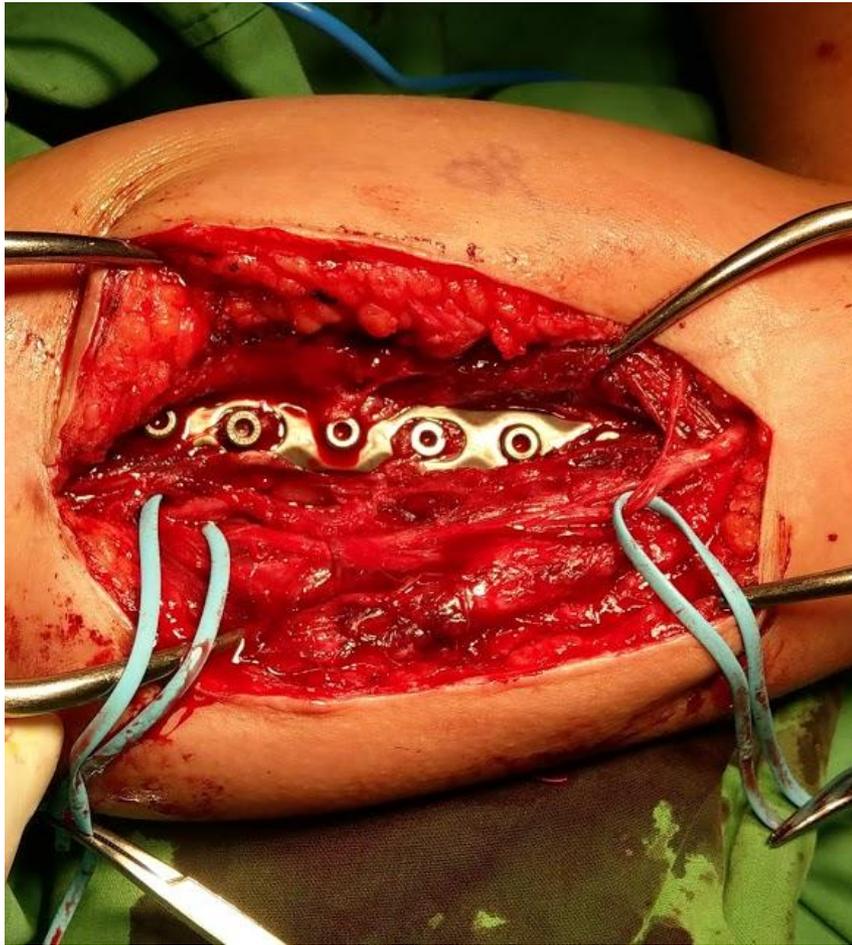

Fig. 1

Treatment algorithm for a radial nerve palsy associated with a fracture of the shaft of the humerus (the role of ultrasound has yet to be properly determined) (EMG, electromyogram; NAP, nerve axonal physiology; NCV, nerve conduction velocity).

Landmarks soft tissue window

retractor

Humeral Shaft Fractures

-Holstein-Lewis fracture)

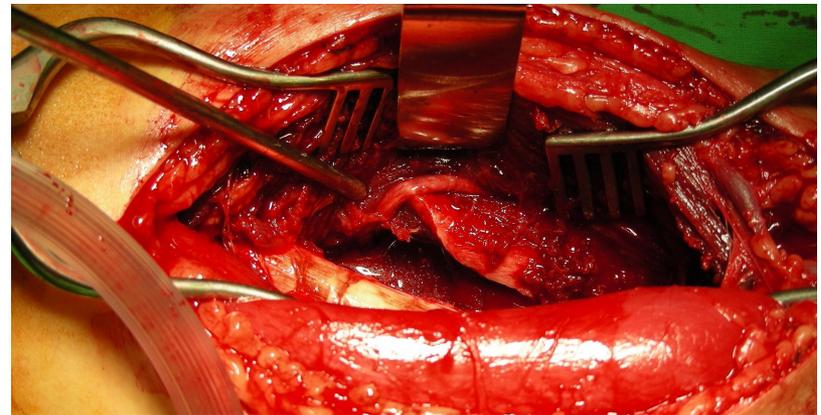

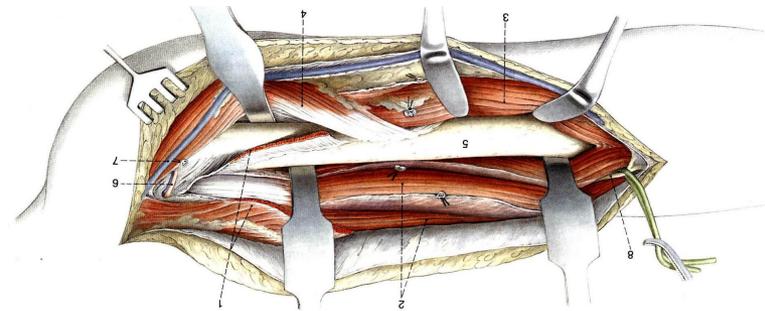

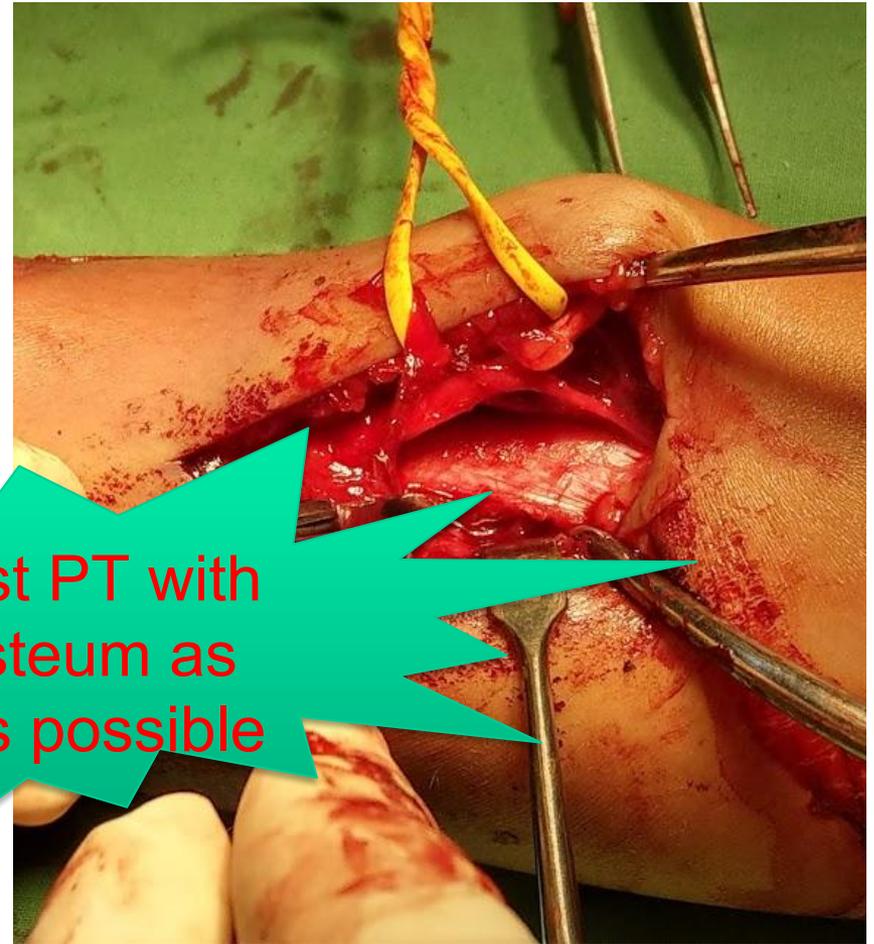

Table 2. Combinations of Transfers

	Authors associated with Transfers(year)	TRANSFERS	Modifications
FCR TRANSFER	Starr(1922) ³² Brand(1985) ⁸ Tsuge Adachi(1980) ⁴⁴	PT to ECRB FCR to EDC PL to rerouted EPL	Tsuge transferred FCR through IOM to EDC
SUPERFICIALIS TRANSFER	Boyes(1960) ⁵ Chiunard(1978) ²⁹	PT to ECRL and ECRB FDS(III) to EDC FDS(IV) to EIP and EPL	FCR also transferred to APL/EPB for thumb abduction
FCU TRANSFER	Jones(1916 and 1921) ^{30,31} Merle D'Aubigné ^{49,33,34} Tubiana ^{45,33,34}	PT to ECRB FCU to EDC PL to rerouted EPL	Jones used FCR to reconstruct thumb and index extension D'Aubigné used PT to ECRL/ECRB;FCU to EDC,EIP and EPL; and PL to EPB/APL Tubiana: PT to ECRB and ECRL which is transferred to base of 4th MC
MODIFICATIONS WHEN PL IS ABSENT		FCR to EDC FDS(IV) through IOM to EPL and EIP OR FDS(IV) rerouted around ulnar side of wrist to EPL and EIP OR FDS(III) rerouted to radial side of wrist to rerouted EPL	Tubiana felt FDS was too strong for thumb extension. For case of absent PL used the following: PT to ECRB and transferred ECRL (to base of 4th) FDS(IV) to EDC(II-V) FCR rerouted on the ulnar side of wrist to EIP and EPL

PT to ECRB

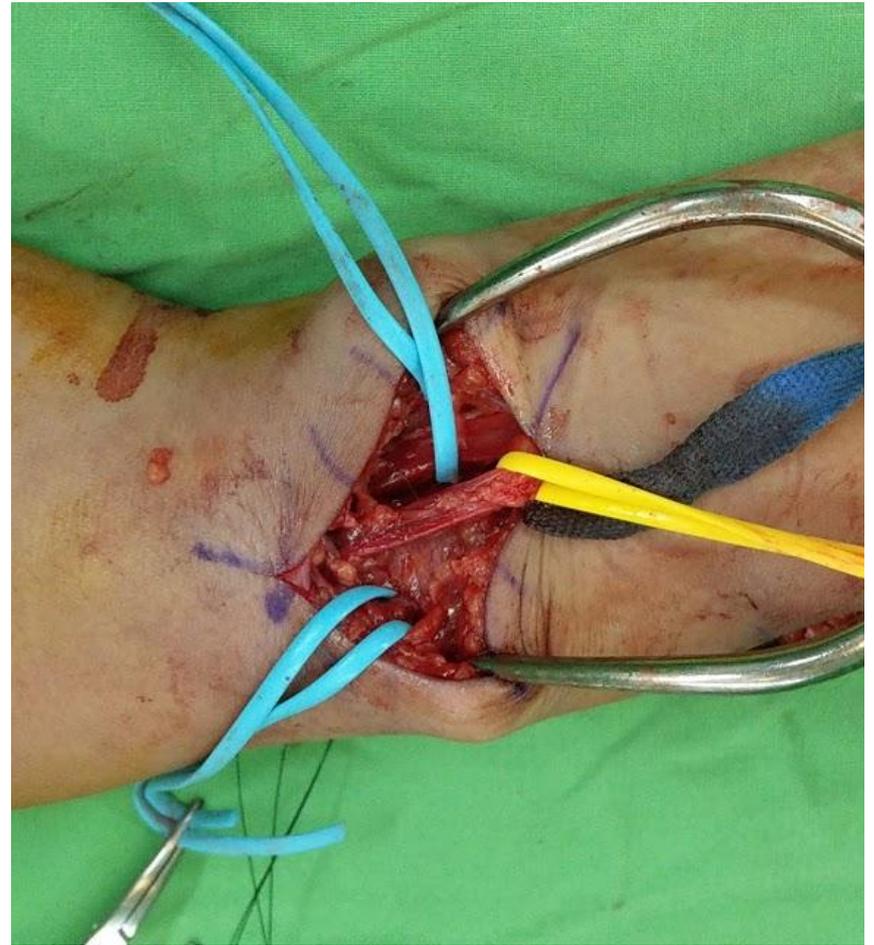

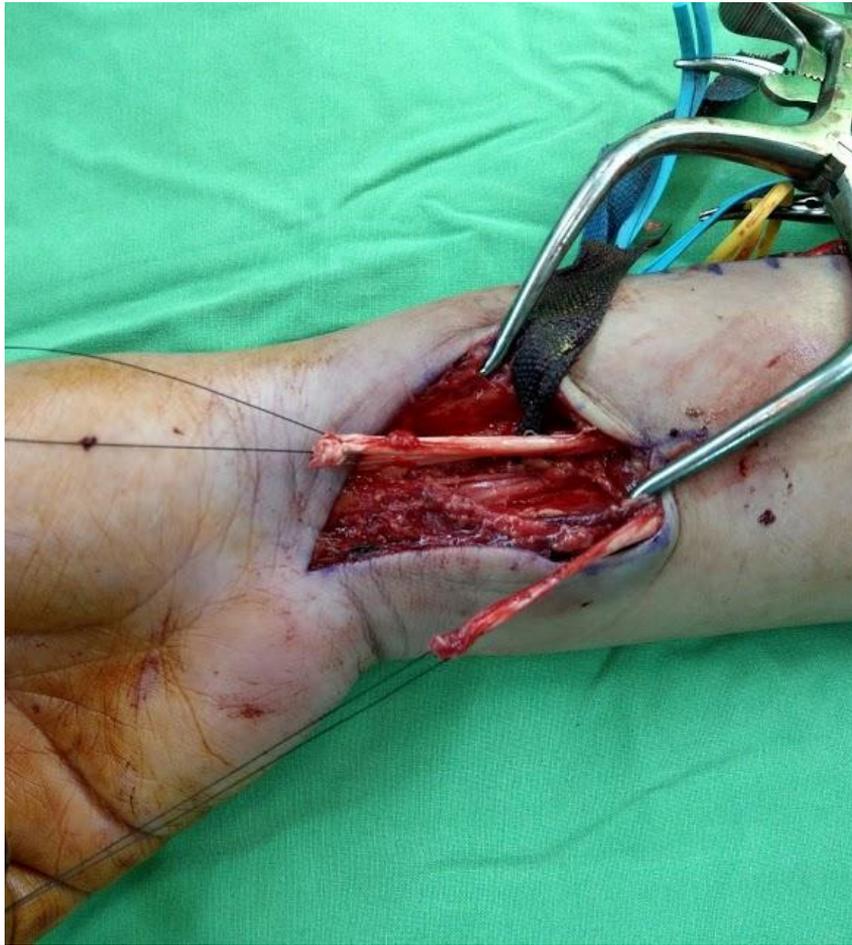

Harvest PT with
periosteum as
long as possible

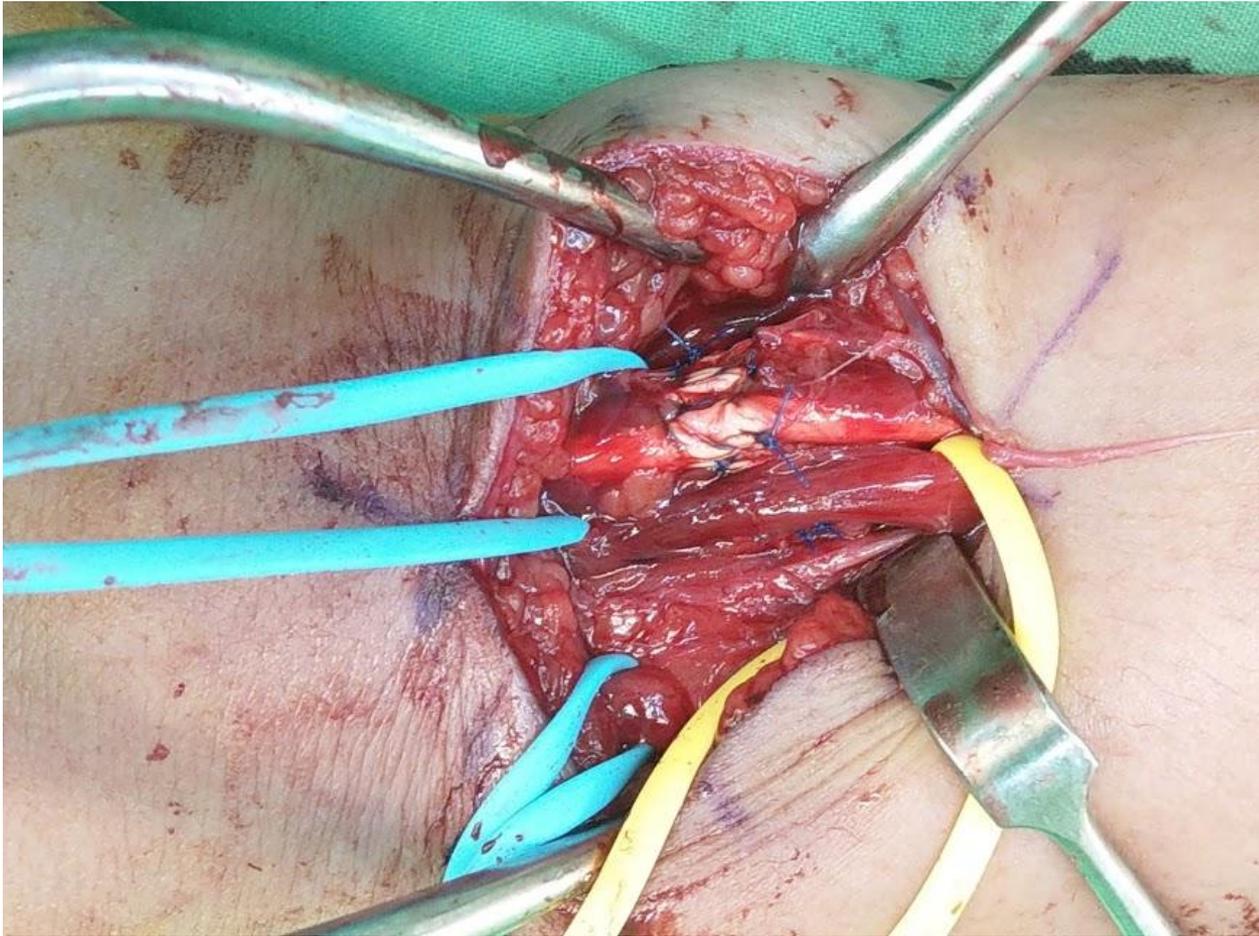

PT to ECRB

PL to EPL/ FCR to EDC

PL to EPL/ FCR to EDC

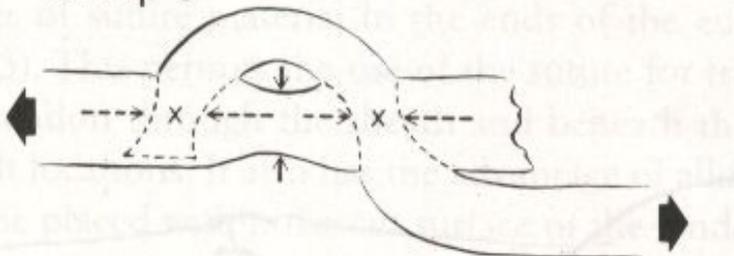

Group 1

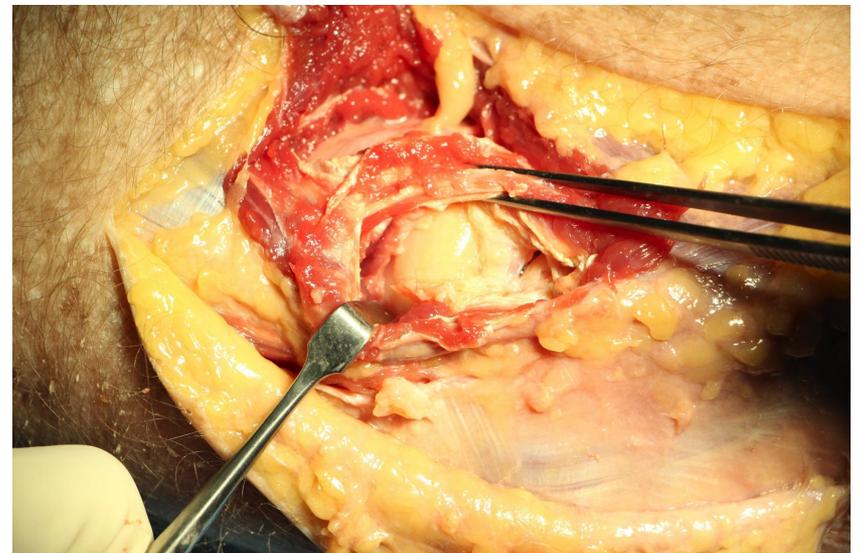

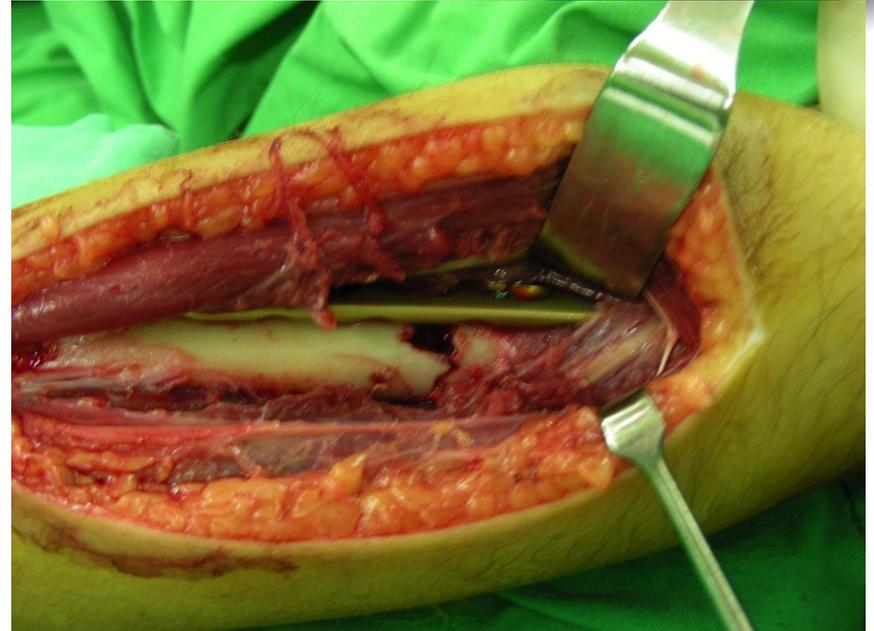

Group 2

Group 3

Low radial nerve palsy

Summary- dorsal approach

- Indications for dorsal plate fixation:
 - Associated intercarpal lig injury
 - Displaced dorsal lunate facet fracture
 - A dorsal shearing radiocarpal fr-dislocation
- Z incision of extensor retinaculum

Summary- Radial N palsy

- Approach matter!
Anterolateral approach
No Hofmann
- High radial nerve palsy
PT to ECRB
Low radial nerve palsy
-PL to EPL
-FCR to EDC
